Line IP-CCTV is a product designed to enable the Line CCTV system to work with IP cameras. It has scratch card activation for 1, 4, 8, 16, 32, 64 and 128 channels for connecting an IP camera. The installation file and all required information can be found on our website.

The software has a unique, intuitive interface that even an inexperienced user will find easy to use.

The maximum number of cameras connected to one video server for Line x32 is up to 64 channels and up to 128 channels for Line x64. This feature is available if a second stream from a digital video camera is connected.

Support for 5389 IP camera models from different manufacturers. If requested by the user, it is possible to integrate Line software with any IP camera (the camera's manufacturer must provide the SDK for the specific model).

Important! To obtain a Line IP licence we recommend only using verified sales representatives and installation organisations. The product is only supplied in three ways: box version, temporary code and code from an online store. Offers for the sale of a licence for the Line CCTV system using a different method of supply may be fraudulent. Using such codes in your CCTV system carries risks such as complete loss of information and system performance, and the manufacturer may refuse to provide technical support or a guarantee.
